

ChatGPT – Document Status Review

Yes. The cleanest way to fix this is to go **section by section** and make every statement agree with one single version of what actually happened.

I'd use the following as your consistency checklist before touching Sections 7-8.

Front matter

Change

The document still has template information such as:

- Anonymous Author(s)
- Anonymous Institution
- Undergraduate CHI-Style Assignment Template

Replace these with your actual authors, institution, and final project title.

No research-consistency issue here; just submission cleanup.

Abstract

Current status: mostly consistent

The abstract describes ReflectBlocks as:

- short thought capture
- optional prompts
- editable/removable questions
- free writing
- explicit generation
- editable generated text
- source transparency
- save/export/delete controls
- still needing evaluation

This is consistent with the rest of the project.

Small change I recommend

You currently say:

“It also shows how the generated text relates to their original responses...”

Keep this phrased as a **proposed design feature**, not something proven effective.

Your final sentence already does this well:

“The effectiveness of this approach still needs to be tested with users.”

So the abstract is basically fine.

1. Introduction

1.1 Problem, Users, and Setting

Keep

The overall framing is consistent:

- quick thought → fuller reflection
- optional blocks
- blank writing
- explicit generation
- editable final entry
- provenance/source markers
- save/export/delete

The important sentence is also good:

“These features are starting ideas, not confirmed user needs.”

That protects you from pretending the initial ReflectBlocks design was discovered from the interviews.

Change one small thing

You say the user can:

“save, export, or permanently delete the entry”

I'd soften “**permanently delete**” throughout the document.

Use something like:

“delete the entry”

and later explain the deletion semantics.

Why? Because elsewhere you correctly acknowledge that external AI services and backups may affect whether deletion can literally be guaranteed everywhere.

Pasted text(20260809-091919)

1.2 Research Questions and Contribution

Keep

RQ1–RQ3 align well with the later sections:

- RQ1 → capture/reflection behavior
- RQ2 → prompts/control/privacy
- RQ3 → source transparency/editability

No major consistency changes needed.

2. Discovering Requirements

2.1 Stakeholders, Assumptions, and Problem Space

Keep

The five assumptions are useful because they're explicitly labelled as assumptions rather than findings.

Especially keep language such as:

“None of these statements is yet a finding.”

That makes the research process much more credible.

Change nothing major here

But make sure later sections don't suddenly treat **all five assumptions as participant findings**. Some requirements like R7/R8/R10/R14 are still based largely on stakeholder/privacy reasoning rather than your interview themes.

That is okay—as long as you keep saying so.

2.2 Current Practice and Opportunity Areas

Keep

This section carefully says:

“reasoned possibilities derived from the proposed concept, not participant findings”

which is exactly what you should say.

Pasted text(20260809-091919)

Change slightly

For statements like:

“A blank page provides freedom but little support...”

and

“A fixed template provides structure but may ask irrelevant questions...”

either:

1. keep them framed as **design hypotheses**, which you currently mostly do, or
2. add journaling/reflection literature later.

Do not rewrite them as established universal facts.

3. Data Gathering – this needs the biggest consistency cleanup

This section needs one single factual story.

3.1 Decide the participant age description

Currently you say both:

“all of them above age 45”

and:

“Eight people took part, mostly above age 45”

Pasted text(20260809-091919)

Pick one.

If all eight were above 45, use everywhere:

“All eight participants were above age 45.”

Then remove every occurrence of:

“mostly above age 45”

3.2 Decide the recruitment description

Currently:

“mostly from our own families”

but later:

“eight family and relative participants”

Pasted text(20260809-091919)

Recommended wording if all were relatives

“We recruited eight participants from our families and extended family networks in Bangladesh.”

Then use the same description everywhere.

If some participants were not relatives, change the requirements section instead.

3.3 Fix the one-month vs two-month conflict

Method says:

“Recruitment and fieldwork took place over a one-month period.”

But your timeline covers Weeks 1–8 and explicitly describes a two-month study.

Pasted text(20260809-091919)

Best consistent version if true

Write:

“The overall study took place over approximately two months, with participant recruitment and interviewing concentrated within roughly one month.”

Then the timeline can remain Weeks 1–8.

If the entire study really lasted only one month, the timeline has to change instead.

3.4 Decide: recordings/transcripts OR written notes

This is the **most important fix**.

Method currently says:

“We took written session notes...”

Pasted text(20260809-091919)

but later says:

“eight interview transcripts”

and:

“Transcribed, pseudonymized P01--P08...”

Pasted text(20260809-091919)

You cannot keep both unless you actually recorded and transcribed the sessions.

If you did NOT audio-record interviews

Change all of these:

Current

eight interview transcripts

To

eight sets of interview notes

Current

read through each transcript

To

read through each participant's interview notes

Current

original transcripts

To

original session notes

Current timeline

Transcribed, pseudonymized P01--P08, coded, and checked themes.

To

Organized and pseudonymized session notes as P01--P08, coded the material, and checked emerging themes.

This would make the document consistent with your stated method.

3.5 Fix quotation handling

Currently you say:

quotations were "translated or lightly paraphrased"

Pasted text(20260809-091919)

A paraphrase shouldn't be shown as an exact quote.

If quotes are genuine translations

Say:

“Selected quotations were translated from Bangla to English while preserving their intended meaning.”

Remove “lightly paraphrased.”

If they came from written notes rather than recordings

Don't present them as exact quotes.

Instead of:

P03 said, “I have the thought...”

write:

P03 described having thoughts while travelling or showering that often disappeared before they had time to write them down.

That is much safer.

3.6 Fix “secure retention”

Your timeline caption currently claims:

“secure retention”

but the Method doesn't tell us:

- where notes were stored
- who had access
- whether identifiers were removed
- when they would be deleted

Pasted text(20260809-091919)

Either add a short data-management statement, e.g.:

“Session notes were labelled only with participant IDs P01--P08 and stored in a team-controlled location accessible only to the researchers.”

only if that's true, or remove “secure retention” from the caption.

4. Data Analysis, Interpretation, and Presentation

4.1 Preparation and Analytic Approach

This section depends entirely on the notes/transcripts decision above.

If you had notes only

Change:

| "the eight interview transcripts"

to:

| "the eight sets of interview notes"

Change:

| "checked each theme against the original transcripts"

to:

| "checked each theme against the original interview notes."

Pasted text(20260809-091919)

4.2 Coding description

You say:

| "Two of us coded the first three transcripts separately..."

If notes were used:

| "Two researchers independently coded the notes from the first three interviews and then compared their coding."

Keep the rest if that is genuinely what happened.

5. Findings

This needs an **evidence audit**, participant by participant.

Theme 1

You state:

“Six of eight participants...”

Pasted text(20260809-091919)

That is fine **only if your raw notes genuinely show six.**

Fix the later traceability entry

Currently:

6 of 8 participants (P01, P03, P04, P07)

which lists only four participants.

Pasted text(20260809-091919)

Use either:

6/8 participants; P03 representative example

or list all six actual IDs.

I prefer the first.

Theme 2

You say:

“Most participants liked having optional prompts...”

but the traceability table only shows:

P02; P05 as counterexample.

Pasted text(20260809-091919)

Fix

If “most participants” really means, say, 5/8 or 6/8, report the actual count:

“Five of eight participants considered optional prompts useful

when relevant...”

Then use:

5/8 participants; P02 representative example; P05 counterexample

If you don't have that count documented, change “Most participants” to something weaker:

“Several participants...”

Theme 3 – verify carefully

You currently say:

“Seven of eight participants wanted a way to compare the generated text with what they originally wrote.”

Pasted text(20260809-091919)

This is a **strong and very specific finding**.

But your appendix guide doesn't currently contain an obvious question that would have generated this evidence.

So either:

If you actually asked about AI-generated text/source transparency

Add the real question(s) to the interview guide.

For example, if actually used:

“If a system organized your answers into a journal entry, would you want to know which parts came from your own responses?”

Then T3 becomes traceable.

If you never asked this

Do not claim 7/8.

You could instead treat source transparency as an **original design hypothesis / stakeholder concern** rather than a major observed theme.

6. Evidence-to-Interpretation Table

This table currently contains timestamps:

- 14:02
- 22:40
- 09:15
- 31:20

Pasted text(20260809-091919)

But interviews are described as:

“about 20 minutes.”

Pasted text(20260809-091919)

If no recordings existed

Remove all timestamps completely.

Use:

</> LaTeX

```
P03 interview notes
P02 interview notes
P05 interview notes
P06 interview notes
```

This solves both the recording/transcript problem and the impossible 31:20 problem.

If recordings did exist

Then fix the stated interview duration and describe recording/transcription properly.

7. Establishing Requirements

This section is structurally strong, but there are several internal mismatches.

7.1 Support threshold

You say a requirement is supported when:

at least two participants independently identified the need, or one participant plus card/stakeholder corroboration.

Pasted text(20260809-091919)

That's okay as **your team's operational rule**.

Just don't present it as a universal HCI standard.

You can say:

“For this project, we treated a requirement as supported when...”

which you already effectively do.

8. Requirements traceability figure

Fix T1:

Current

6 of 8 participants (P01, P03, P04, P07)

Change

6/8 participants; P03 representative example

Fix T3:

Current

7 of 8 participants (P06); P08 wants blank writing only

Change

7/8 participants; P06 representative example; P08 preferred blank writing only

Pasted text(20260809-091919)

This is much clearer.

9. MoSCoW Prioritization

This is another major consistency problem.

Your own rule says:

Must = at least half the participants OR privacy/action-without-knowledge concern.

Should = concerns raised by only one or two participants.

Pasted text(20260809-091919)

But:

R2 = Must
Evidence = P02

Pasted text(20260809-091919)

You have two options

If R2 really was supported by ≥ 4 participants, update its evidence.

For example:

T2; 5/8 participants; P02 representative example

Then **Must** is consistent.

Otherwise change R2:

Must → **Should**

Do **not** alter the evidence just to justify the priority.

10. Acceptance Criteria

You say:

“For each Must requirement we specify a testable acceptance criterion.”

But you list only:

- R1
- R4
- R7
- R8
- R12

Pasted text(20260809-091919)

Yet R2 and R5 are also Must.

Add R2 and R5 if they remain Must

For R2:

R2. Given an irrelevant reflection prompt, the writer can dismiss it with one visible action without entering settings or affecting other blocks.

For R5:

R5. Given a generated entry, the writer can identify which original block or blocks contributed to each generated passage.

Then your statement becomes true.

11. R5 evidence notation

Current:

T3; P06 (7/8)

Pasted text(20260809-091919)

Change to:

T3; 7/8 participants; P06 representative example

assuming the 7/8 is genuine.

12. R9 needs rewriting or weaker evidence

Current R9 says:

“A writer with limited experience using text-editing apps...”

Evidence:

Participant sample (8/8 aged 45+)

Pasted text(20260809-091919)

Age does not prove limited app experience.

Safest change

Rewrite R9 as:

R9 – Quality: The initial thought-capture interaction shall use familiar tap-and-type actions and shall not require a new gesture or hidden menu.

Evidence:

Inclusive-design consideration; participant sample all above 45;
requires validation

Then keep it **Should / provisional**.

This is much more defensible.

13. R8 permanent deletion

Current:

“permanently delete...”

and:

“deletion irreversible once confirmed.”

Pasted text(20260809-091919)

I'd change R8 to:

The system shall let a writer request deletion of saved blocks and generated entries independently, clearly communicate the scope of deletion, and require confirmation before the deletion action is performed.

This avoids promising something your conceptual system cannot yet technically guarantee.

14. R10 privacy requirement

Current R10 says:

show what data leaves the device, to whom, and why.

Pasted text(20260809-091919)

But your actual project definition also promises:

- what is stored
- where it is stored
- whether AI is used
- how deletion works

Expand R10

Something like:

Before any generation request is sent, the system shall explain in plain language which data is selected, whether it leaves the device, who processes it, why it is processed, and what storage or retention applies.

Then R8 can cover deletion separately.

15. R13

This is actually handled correctly.

You explicitly admit:

block customization wasn't directly evidenced in interviews.

Pasted text(20260809-091919)

Keep that.

Do not artificially create participant evidence for R13.

Your original project can contain design ideas that remain provisional.

16. Conceptual Design

Structurally this section is consistent with R1-R14.

A few phrases should change based on earlier fixes.

Change “all older adults”

Current:

“particularly relevant given that the study participants were all older adults...”

Use instead:

“particularly relevant given that all participants in our sample were above age 45...”

if true.

This avoids arbitrarily classifying 46-year-olds as “older adults.”

Change claims that sound too certain

Current:

“A fixed sequence of questions lowers the decision cost...”

Better:

“A fixed sequence of questions may reduce the need to decide what to answer next...”

Current:

“It can also be highly learnable...”

Better:

“Its stable structure may also improve predictability across sessions...”

Current:

“A conversational sequence can make it difficult...”

Better:

“We were concerned that a conversational sequence could make it harder to see which answers remain active...”

These become **design reasoning**, not unsupported empirical claims.

17. Conceptual design scenario

This section is mostly consistent.

But this sentence:

“the thought is already safe”

should probably become:

“the thought has been captured”

unless you have defined exactly what “safe” means technically.

“Safe” can imply security guarantees you haven't established.

18. Requirement-to-design mapping

The R1-R14 mapping is good.

Just make sure any changes to:

- R2 priority
- R8 wording

- R9 wording
- R10 wording

are propagated into this table.

For example if R8 changes from “permanent deletion” to “deletion scope + confirmation,” its conceptual-design response should also change.

19. References

Three cleanup items.

Norman

Check publisher/edition details. Your current citation mixes the 2013 revised edition with MIT Press.

Rogers / Sharp / Preece

Correct author order to:

Yvonne Rogers, Helen Sharp, Jennifer Preece.

Muller

Change:

1993

to:

2003

for *Participatory design: The third space in HCI*.

Also, later I'd add a few ReflectBlocks-specific sources on:

- digital journaling
- prompted reflection
- AI-assisted writing/authorship
- privacy/transparency

because currently almost all references are methodology textbooks/classics.

Pasted text(20260809-091919)

20. Appendix – very important

This cannot remain template material.

Participant Information and Consent Checklist

Currently it's instructions telling you what you should include.

Pasted text(20260809-091919)

Replace it with the **actual de-identified consent/information process you used.**

Interview Guide

Current:

</> LaTeX

Tell me about the last time you [performed the focal activity].

Pasted text(20260809-091919)

That absolutely must be replaced.

It needs to reflect your **real interview questions**, not ideal questions invented afterward.

Most importantly, if T3 really came from the interviews, include the genuine question/follow-up that elicited views about:

- AI-organized text
- original vs generated writing
- authorship/source transparency

Otherwise T3 and the appendix don't line up.

Analysis Audit Trail

Currently still entirely placeholder text.

Pasted text(20260809-091919)

You'll need:

- a 100–200 word reflexive memo

- at least a few real de-identified evidence → code → theme examples
- one negative/counterexample such as P05 or P08

This is actually where P05 and P08 become useful because they demonstrate you didn't simply ignore evidence that contradicted the majority pattern.

The single consistent story your finished paper should tell

After all these edits, the entire document should follow one factual chain:

8 participants → all [actual age description] → actual recruitment source → actual study duration → ~actual session length → written notes OR recordings/transcripts → actual questions/card exercise → coding of that actual evidence → T1/T2/T3 with defensible counts → R1-R14 → conceptual design.

Anything that cannot be traced through that chain should be labelled either:

design hypothesis, stakeholder-derived requirement, provisional requirement, or future evaluation question.

If you make those changes, Sections 1-6 will feel like they were written by **one team with one methodology**, rather than parallel sections stitched together.
